

Experiment 4

Student Name: Rakshit Chauhan

UID: 23BCS12628

Branch: CSE

Section/Group: KRG 3-B

Semester: 6th

Date of Performance: 03/02/2026

Subject Name: Full Stack Development – II

Subject Code: 23CSH-309

1. Aim: To optimize the performance of the EcoTrack React application using **memoization techniques** and **code splitting**, and to enhance the user interface using **enterprise-grade Material UI components**.

2. Objective:

- Understand the causes of unnecessary re-renders in React applications
- Optimize React components using React.memo to prevent avoidable re-renders
- Apply useMemo to efficiently compute derived data and avoid redundant calculations
- Use useCallback to memoize event handler functions and improve component performance
- Implement lazy loading of components and routes using React.lazy and Suspense
- Reduce initial bundle size and improve application load performance through code splitting
- Enhance the visual appearance and usability of the EcoTrack application using Material UI components
- Design a clean, consistent, and responsive user interface using Material UI layouts and typography

3. Implementation / Code:

Tools & Technologies Used:-

- React.js
- React Hooks (useMemo, useCallback)
- React Memo (React.memo)
- Material UI (MUI)
- JavaScript (ES6)
- VS Code
- Web Browser (Google Chrome / Firefox)

Implementation Description:-

- The EcoTrack application is optimized to improve **performance and user experience**.
- **Unnecessary component re-renders** are reduced using React.memo, which ensures components re-render only when their props change.

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CHANDIGARH
UNIVERSITY

Discover. Learn. Empower.

- The useMemo hook is used to memoize **expensive calculations**, preventing repeated execution on every render.
- The useCallback hook is applied to memoize **event handler functions**, ensuring stable function references across renders.
- Material UI components such as Container, Typography, Button, List, and Divider are used to create a **professional, responsive, and consistent UI**.
- The optimized structure improves application scalability, performance, and maintainability.

Sample Code Snippet:-

```
⌚ EcoItem.jsx U X
experiment-4-memoization > ecotrack > src > components > ⌚ EcoItem.jsx > ...
1 import React from "react";
2 import { ListItem, ListItemText } from "@mui/material";
3
4 const EcoItem = React.memo(({ name }) => {
5   console.log("Item rendered:", name);
6   return (
7     <ListItem>
8       <ListItemText primary={name} />
9     </ListItem>
10  );
11);
12
13 export default EcoItem;
14 |
```

```
⌚ EcoList.jsx U X
experiment-4-memoization > ecotrack > src > components > ⌚ EcoList.jsx > ...
1 import { List } from "@mui/material";
2 import EcoItem from "./EcoItem";
3
4 function EcoList({ items }) {
5   return (
6     <List>
7       {items.map((item) => (
8         <EcoItem key={item} name={item} />
9       ))}
10    </List>
11  );
12}
13
14 export default EcoList;
15 |
```

⚙ ImpactCalculator.jsx U X

```
experiment-4-memoization > ecotrack > src > components > ⚙ ImpactCalculator.jsx U X
1  import { Typography } from "@mui/material";
2  import { useMemo } from "react";
3
4  function ImpactCalculator({ value }) {
5    const result = useMemo(() => {
6      console.log("Calculating impact...");
7      let total = 0;
8      for (let i = 0; i < 1000000; i++) {
9        total += value;
10     }
11     return total;
12   }, [value]);
13
14   return (
15     <Typography>
16       | Environmental Impact: {result}
17     </Typography>
18   );
19 }
20
21 export default ImpactCalculator;
22
```

⚙ MemoButton.jsx U X

experiment-4-memoization > ecotrack > src > components > ⚙ MemoButton.jsx U X

```
1  import React from "react";
2  import { Button } from "@mui/material";
3
4  const MemoButton = React.memo(({ text, onClick }) => {
5    console.log("Button rendered");
6    return (
7      <Button variant="contained" onClick={onClick}>
8        | {text}
9      </Button>
10    );
11  });
12
13 export default MemoButton;
14
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

```
App.jsx U X
experiment-4-memoization > ecotrack > src > App.jsx > App
8  function App() {
20
21    return (
22      <Container sx={{ mt: 4 }}>
23        {/* App Title */}
24        <Typography variant="h4" gutterBottom>
25          EcoTrack App
26        </Typography>
27
28        {/* Counter Section */}
29        <Typography variant="h6">
30          Count: {count}
31        </Typography>
32
33        <MemoButton
34          text="Increase Count"
35          onClick={increaseCount}
36        />
37
38        <Divider sx={{ my: 3 }} />
39
40        {/* Impact Section */}
41        <Typography variant="h6">
42          Environmental Impact Value
43        </Typography>
44
45        <MemoButton
46          text="Increase Impact"
47          onClick={() => setImpact((prev) => prev + 1)}
48        />
49
50        <ImpactCalculator value={impact} />
51
52        <Divider sx={{ my: 3 }} />
53
54        {/* List Section */}
55        <Typography variant="h6">
56          Eco Items
57        </Typography>
58
59        <EcoList items={ecoItems} />
60      </Container>
61    );
62 }
```

4. Output:

- The EcoTrack application renders efficiently with reduced unnecessary re-renders

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CHANDIGARH
UNIVERSITY

Discover. Learn. Empower.

- Memoized components render only when required
- Expensive computations execute only when dependent values change
- Event handlers remain stable across renders
- Application UI is clean, responsive, and visually consistent
- Performance improvement is observed during state updates
- Material UI enhances professional appearance and usability

EcoTrack App

Count: 1

[INCREASE COUNT](#)

Environmental Impact Value

[INCREASE IMPACT](#)

Environmental Impact: 3000000

Eco Items

Tree

Water

Energy

The screenshot shows the EcoTrack App running in a browser. On the left, there's a counter labeled 'Count: 1' with a blue button to 'INCREASE COUNT'. Below it is an environmental impact section with a button to 'INCREASE IMPACT' and a value of 'Environmental Impact: 3000000'. On the right, there's a list titled 'Eco Items' with three items: 'Tree', 'Water', and 'Energy'. To the right of the app is the Chrome DevTools Console tab, which displays a log of React component rendering and calculation events. The log includes entries like 'Button rendered' (multiple times), 'Calculating impact...' (multiple times), and 'Item rendered' for various eco-items. The DevTools interface also shows a 'What's new' section at the bottom.

5. Learning Outcomes (What I Have Learnt):

- Identify causes of performance issues in React applications
- Use React.memo to optimize component rendering
- Apply useMemo for expensive calculations
- Implement useCallback to optimize event handlers
- Improve application performance and scalability
- Use Material UI for enterprise-grade UI design
- Build efficient, optimized, and professional React applications
